CATEGORIZATION OF IMPAIRMENTS AFFECTING A COMMUNICATION CHANNEL

Haixiang Liang

This patent application claims benefit of U.S. Provisional Application No.
5 60/146,780, filed July 31, 1999.

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to data communications, and more particularly,
to digital impairment learning for pulse-code modulation (PCM) modems used in
10 transmission paths compatible with digital modulation.

Description of the Related Art

Much of the public switched telecommunications network (PSTN) is
implemented using digital data transport. Nonetheless, significant portions of the
PSTN are still based on analog technology. For example, the "local loop" portion of
15 PSTN that connects a telephone subscriber to a central office (CO) is typically an
analog loop. Additionally, analog portions may exist at other points along a
communications path, e.g., as an analog channel in an otherwise digital circuit.

To achieve high downstream data rates in the PSTN, the current generation of
56 Kbps modems no longer treat the communications path as an analog channel.
20 Instead, such modems assume that there is only one (1) analog portion in a
downstream transmission path from a digitally connected server modem to a client
modem connected to an analog local loop. This configuration is reasonable in areas
where most Internet Service Providers (ISPs) and business customers are digitally
connected to the network and allows data signaling rates of up to 56 Kbps in the
25 downstream transmission path.
